handling	Ensure sufficient air exchange and/or extraction in the work area Air extraction is required for spray application. For solid products: Avoid dust formation and dust deposits. Air limit values mentioned in section 8 must be monitored. At workplaces where isocyanate aerosols and/or vapours ca occur in higher concentrations, targeted air extraction must b used to prevent the occupational hygiene limit value from bein exceeded. The air must be moved away from people. For products containing solvents: Explosion protection required. The personal protective measures described in section 8 must b observed. The protective measures required when handlin isocyanates must be observed. Avoid contact with skin and eye and inhalation of vapours. Keep away from food and beverages. Wash hands before break and at the end of work and apply skin protection ointment. Stor work clothes separately. Remove soiled, soaked clothin immediately.

	(Contd. of page 5) The thickness of the material is not the only criterion for the level of protection of a glove against a chemical substance. The protective effect also depends to a large extent on the type of glove material. Depending on the type and material, the thickness must be more than 0.35 mm to ensure adequate protection in the event of prolonged and frequent contact. Exceptions to this rule are multi- layer gloves, which guarantee sufficient protection even with a thickness of less than 0.35 mm during prolonged wear. Other glove materials with a thickness of less than 0.35 mm only provide sufficient protection for short periods of wear. For solvent-free products: Example: Polychloroprene - CR: thickness ≥0.5mm; breakthrough time ≥480min. Nitrile rubber - NBR: thickness ≥0.35mm; breakthrough time
	<u>></u> 480min.
	Butyl rubber - IIR: thickness ≥0.5mm; breakthrough time ≥480min.
	Fluoro rubber - FKM: thickness ≥0.4mm; breakthrough time ≥480min.
	Recommendation: Dispose of contaminated gloves.
